# The FIB lab

established 2010 ...

Scope

# **BACKGROUND FROM PATHWAYS TO IMPACTS WHAT NEXT?**

A little context

# **BACKGROUND**

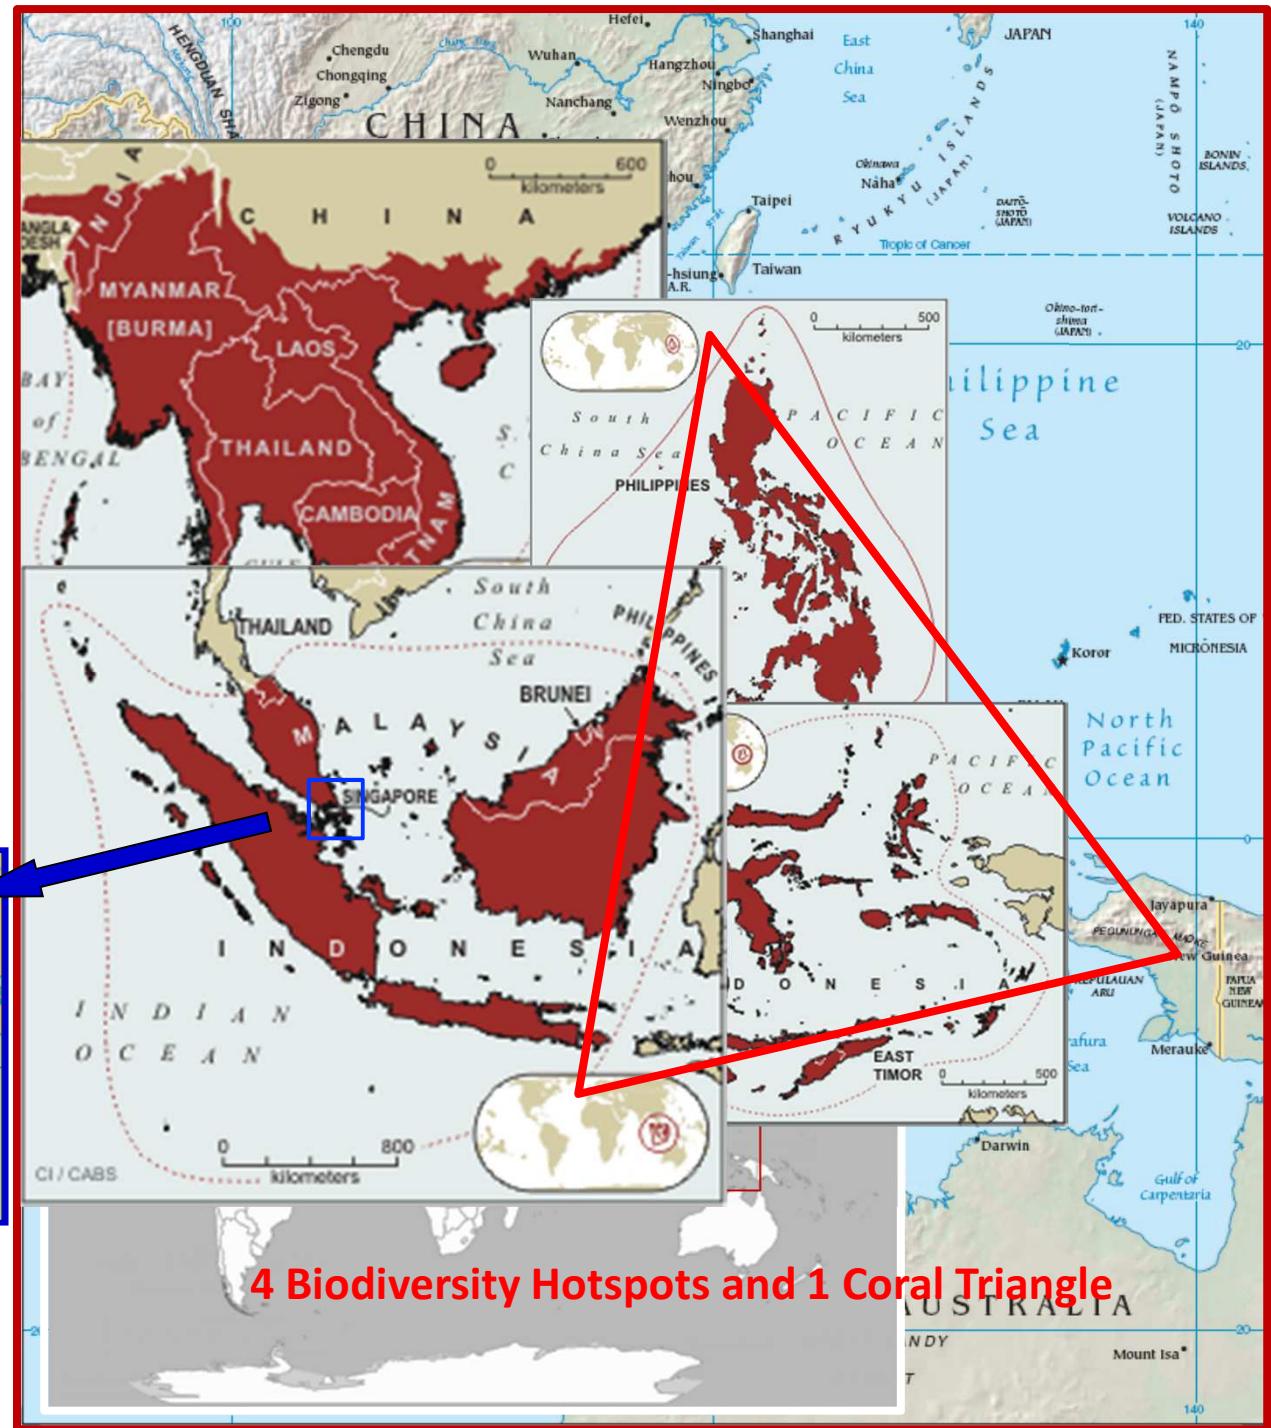

Background

# Where is Singapore?

- Southeast Asia
- ~1 deg N of equator
- Island city state
- Land area ~719 km<sup>2</sup>  
(278 sq mi)

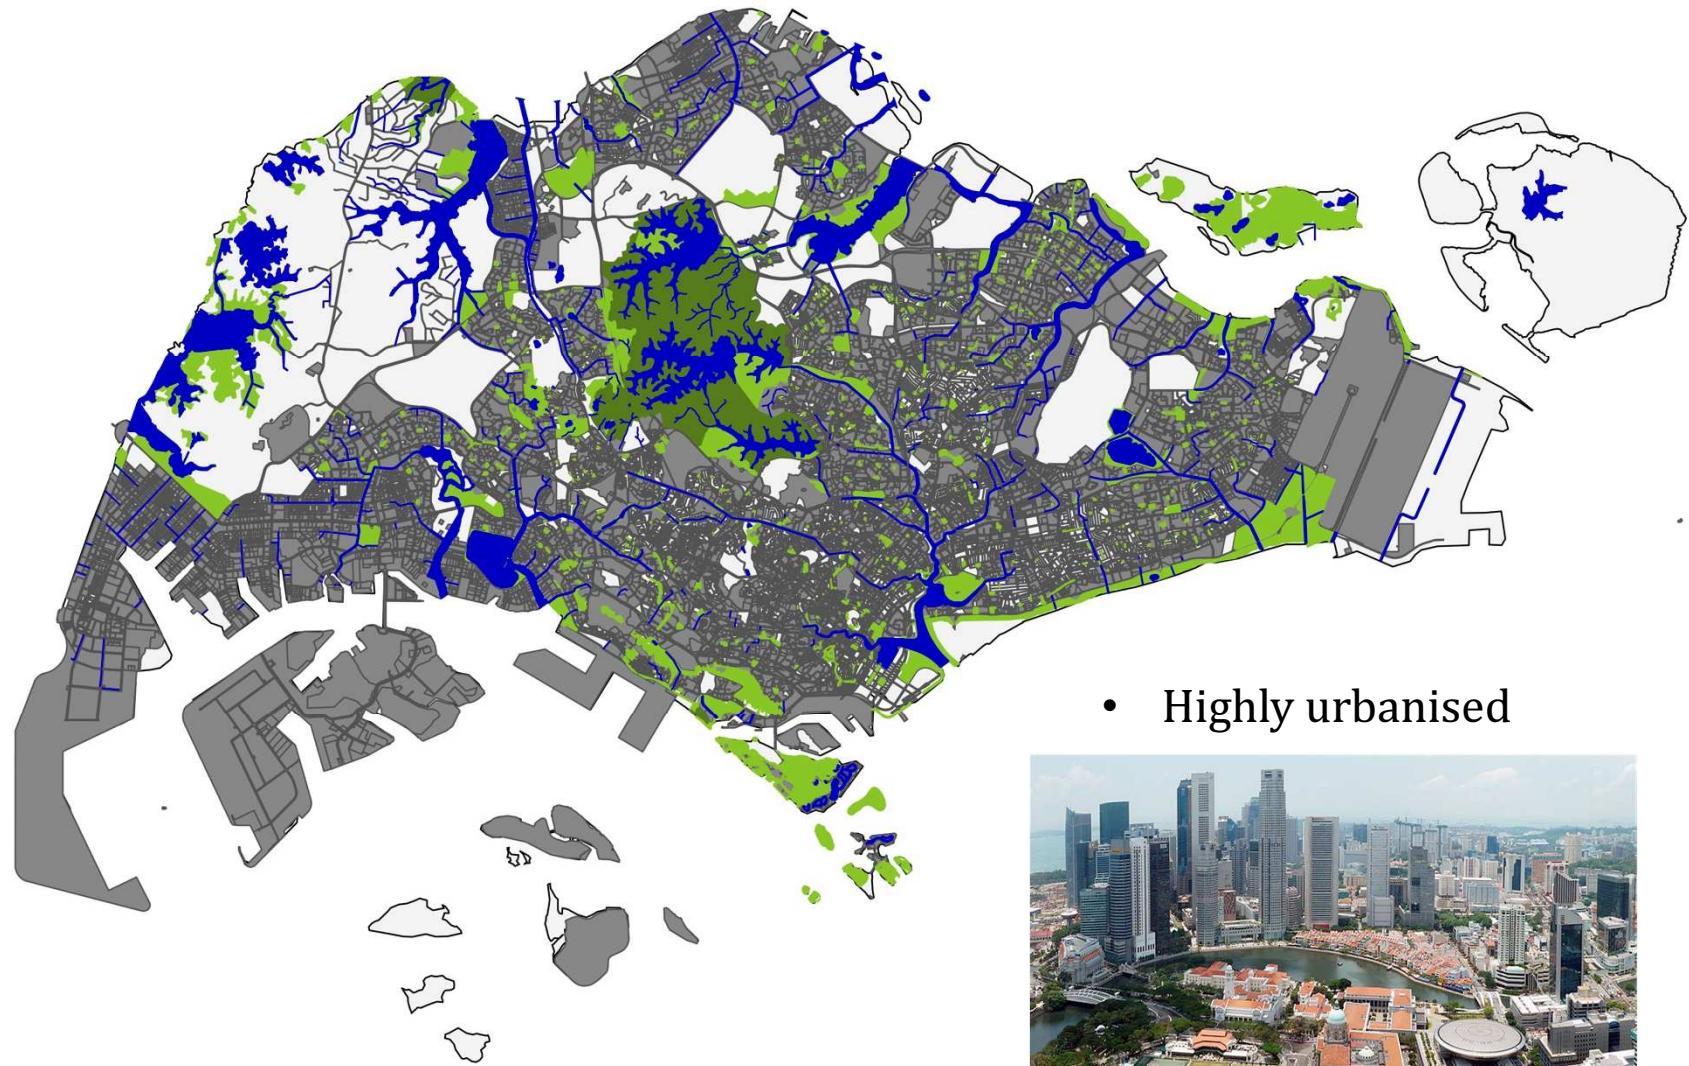

...very small

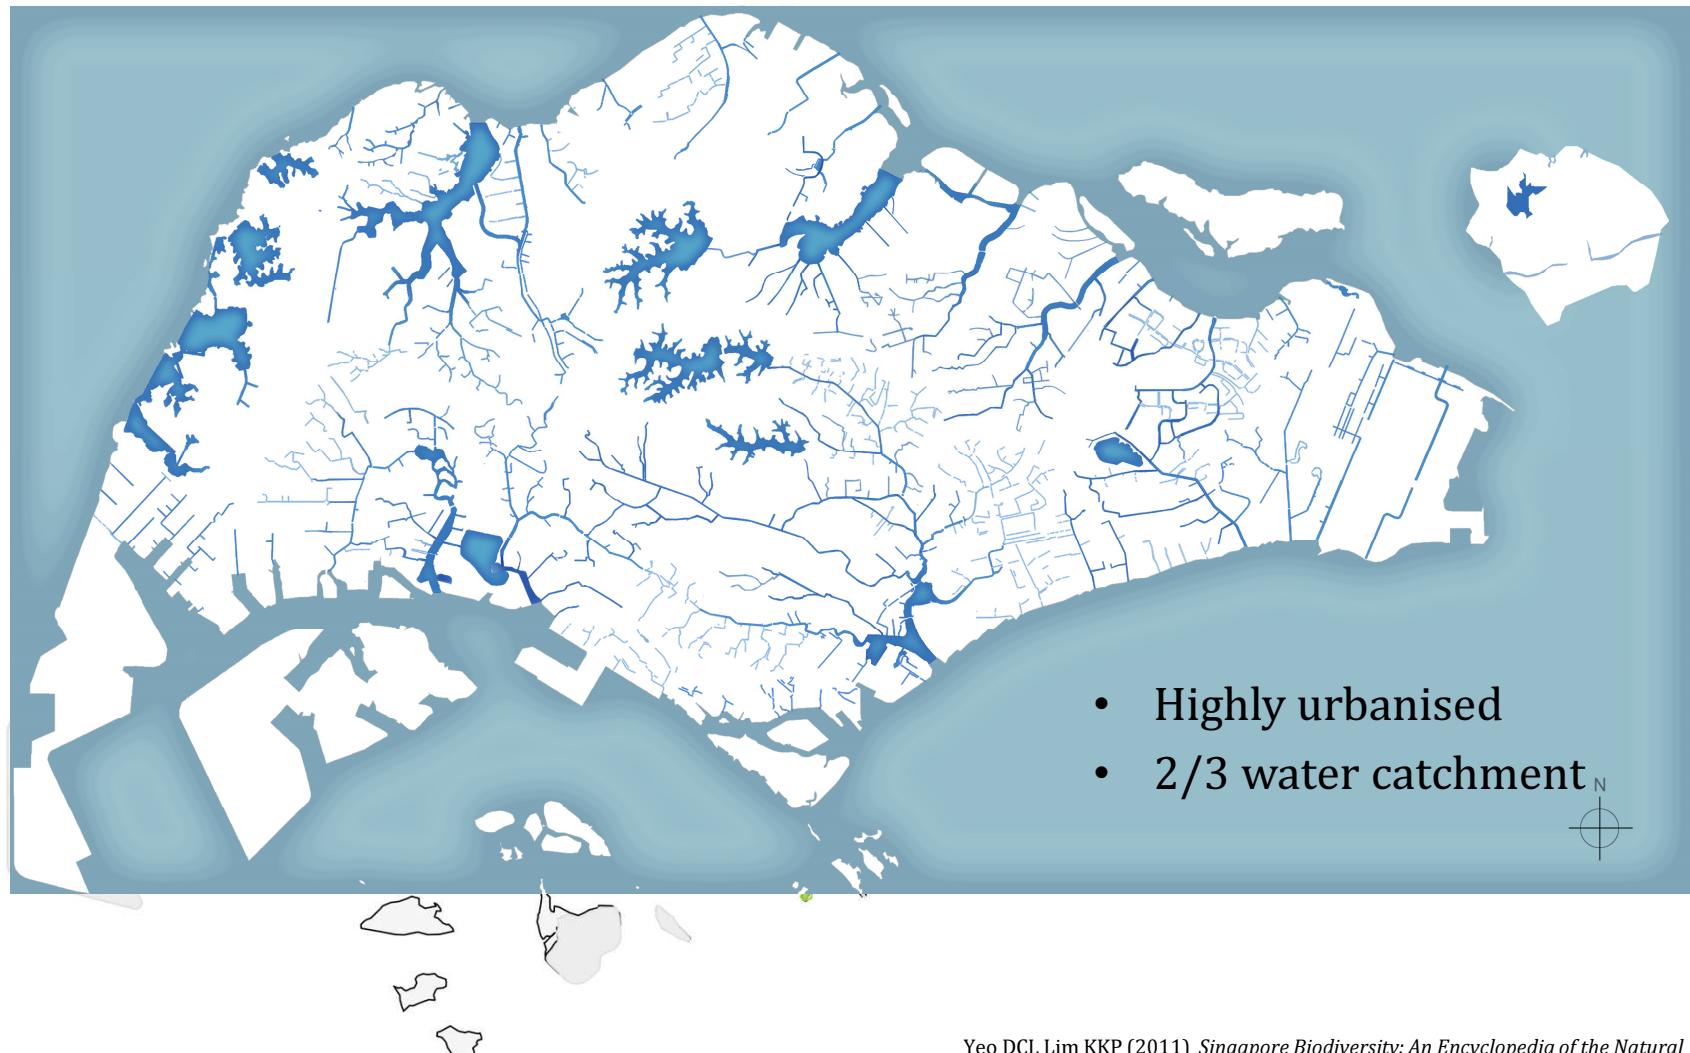

*Background*

# Singapore, a city in a garden

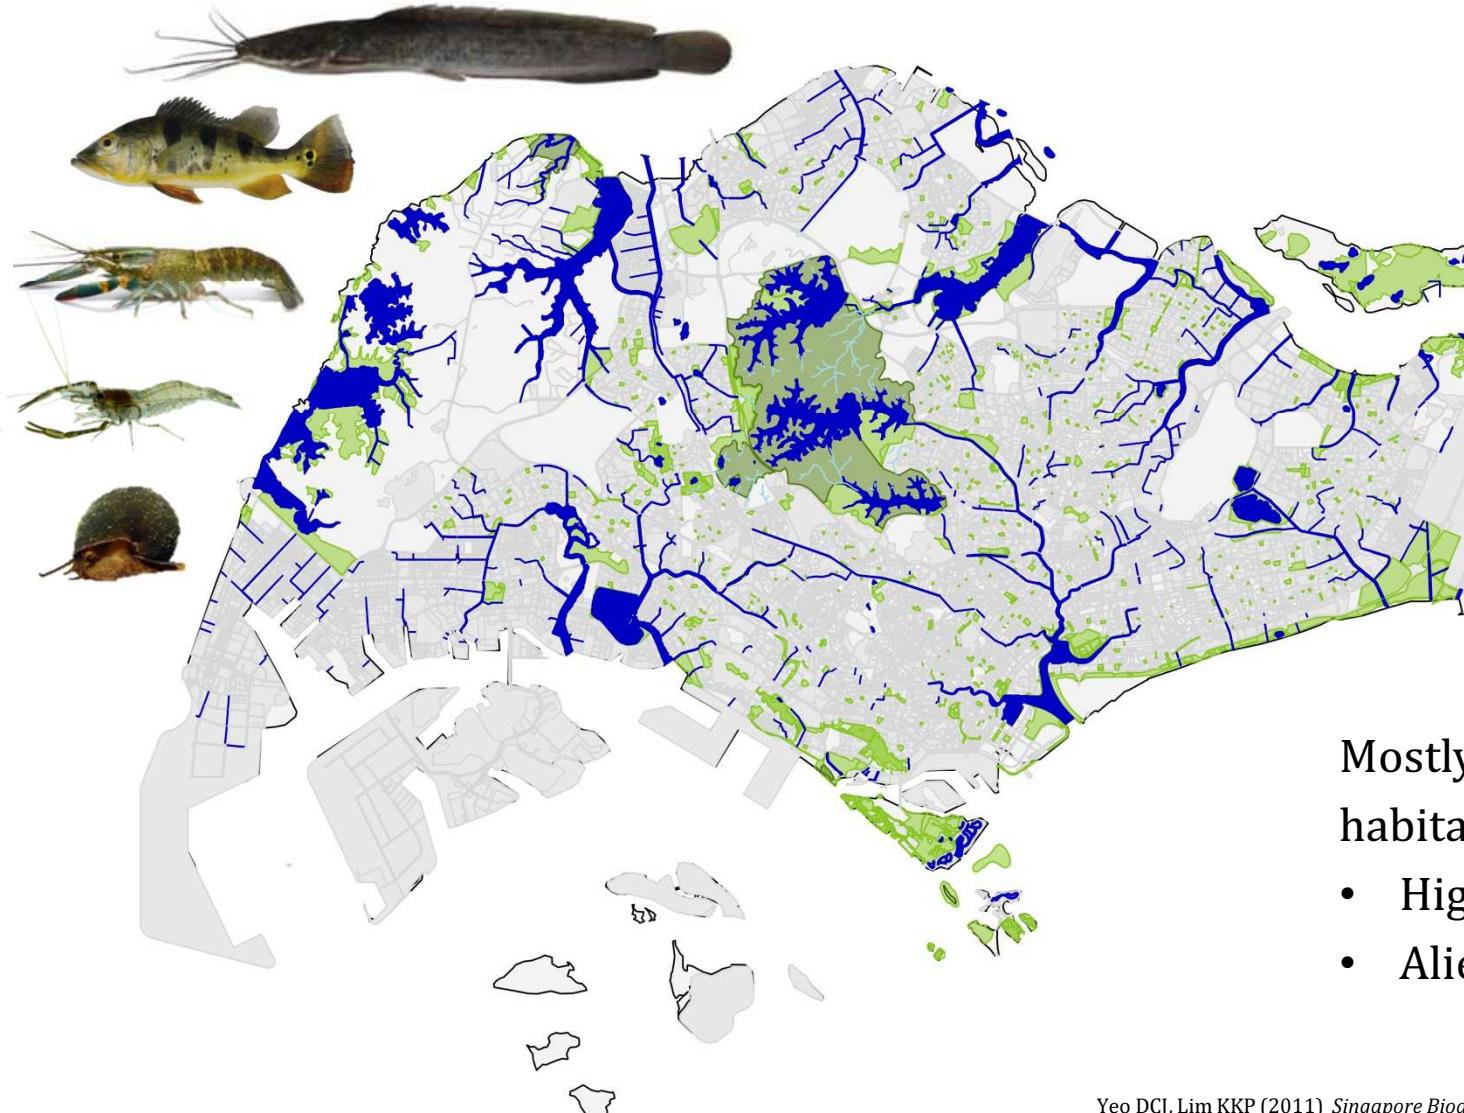

*Background*

# Fresh waters of Singapore:

*Background*

# Fresh waters of Singapore: urban freshwater habitats

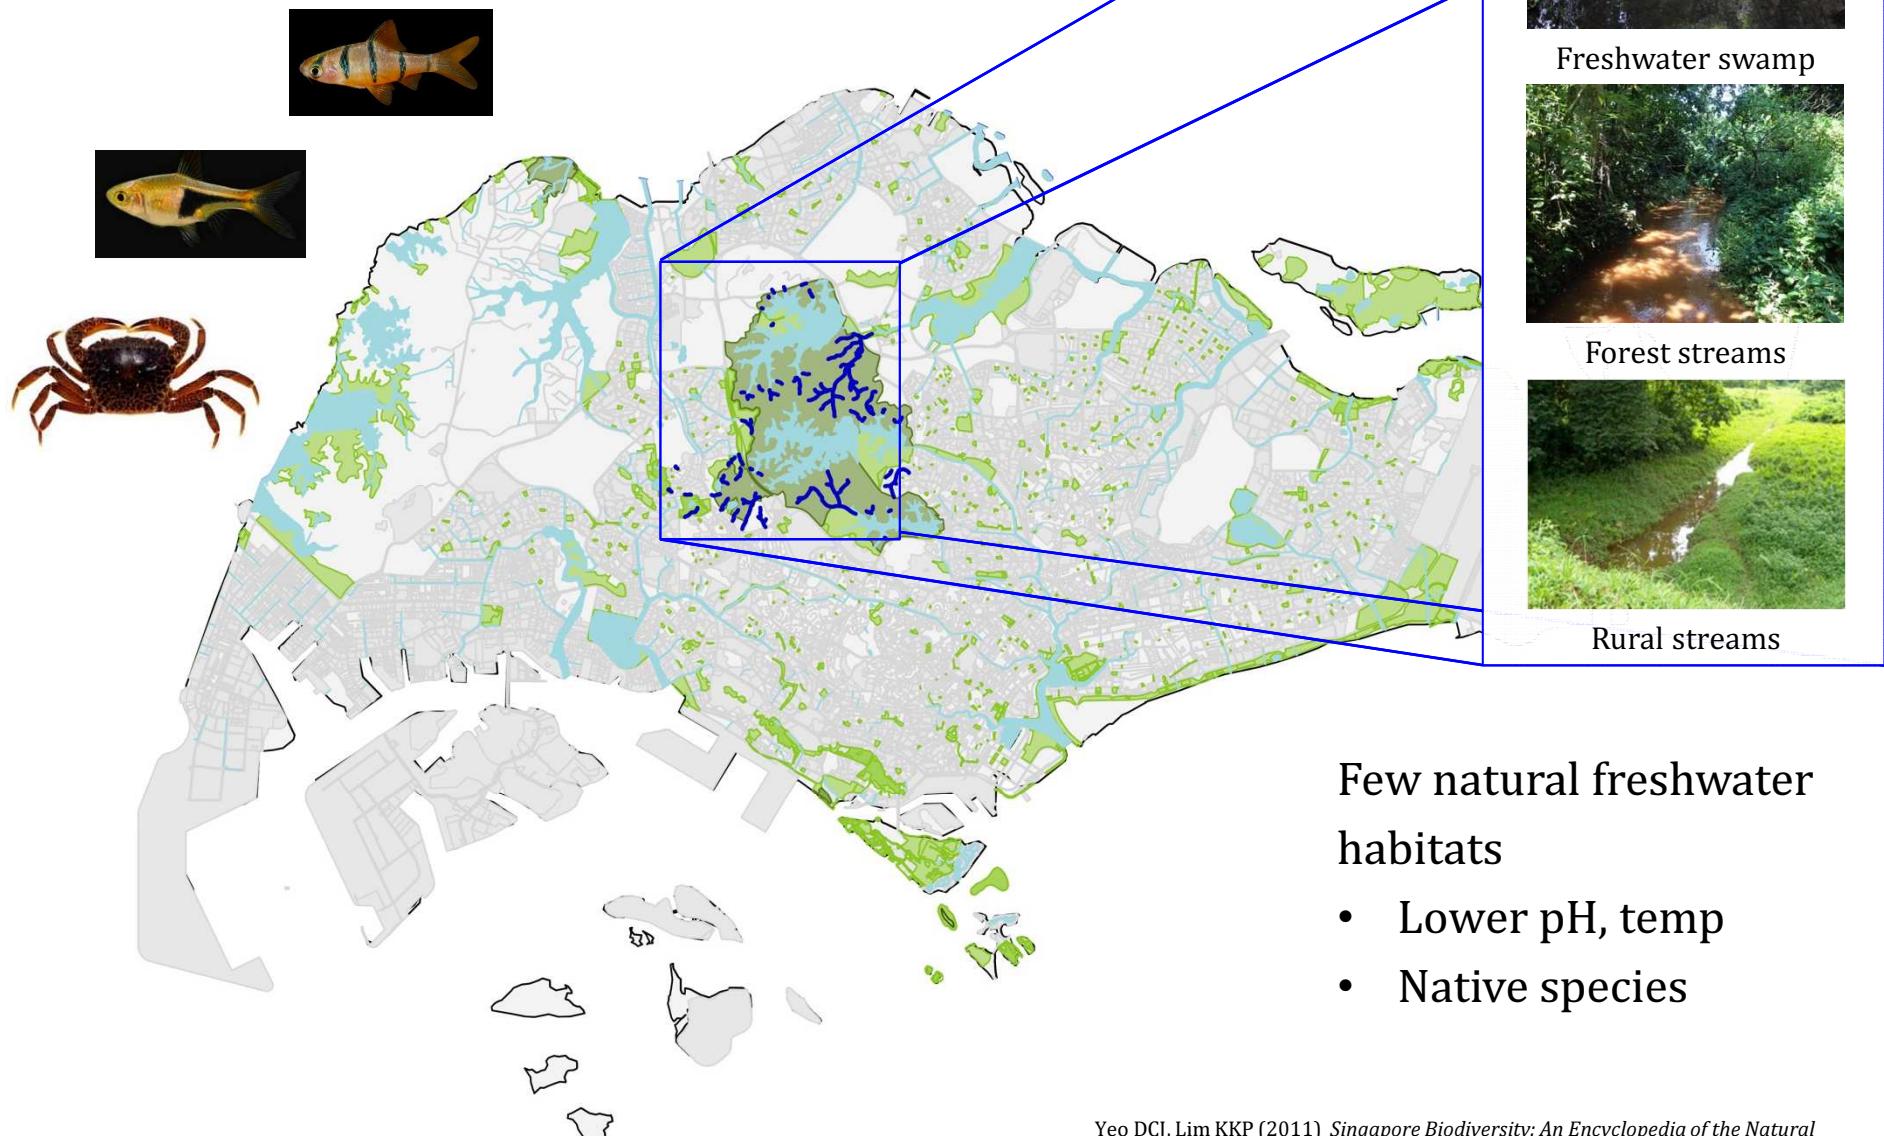

Mostly urban freshwater habitats

- Higher pH, temp
- Alien species

*Background*

# Fresh waters of Singapore: natural freshwater habitats

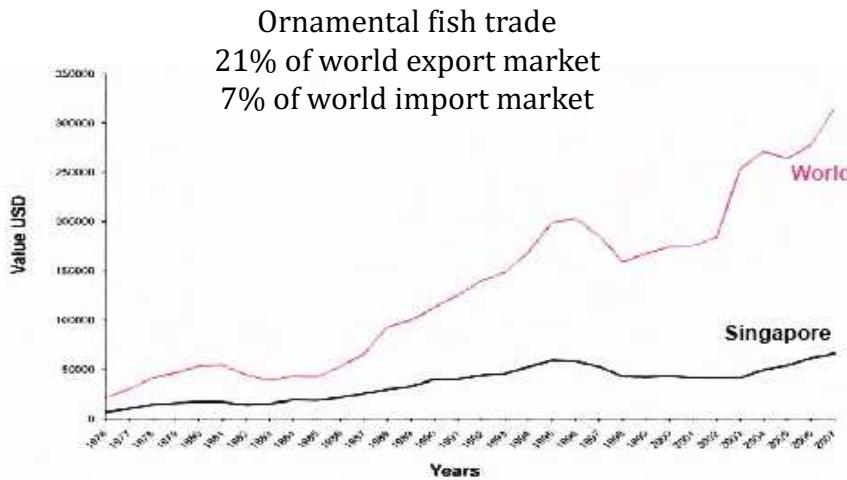

Yeo DCJ, Lim KKP (2011) *Singapore Biodiversity: An Encyclopedia of the Natural Environment and Sustainable Development* (Chapter: Freshwater Ecosystems);  
Yeo DCJ, Wang LK, Lim KKP (2010) *Private Lives: An Exposé of Singapore's Freshwaters*

## Background

# Singapore...a hotbed for freshwater invasions

International/ regional trade hub

Among the world's busiest ports

2.5 billion gross tonnage in 2015

- >325 exotic vascular plants
- >163 introduced animal species
  - mostly aquatic—mostly freshwater:
    - >50 fishes
    - 5 decapod crustaceans
    - 29 molluscs
    - 4 amphibians
    - 18 reptiles

Including some of the World's Worst Invasive Species

Asian clam  
*Corbicula fluminea*

Golden apple snail  
*Pomacea* sp.

## Background

- Alien species
  - No specific studies prior to 2010 (apart from new records)
  - Ecology and impacts poorly known
  - Favour urban (artificial/modified) habitats—but still a potential threat to native biodiversity and ecosystems...

Typical aquatic alien species habitat

### Stingrays breeding in Upper Seletar

Non-native species with venomous sting likely released into reservoir by hobbyists

By Grace Chia

IT IS official. Freshwater stingrays the size of dinner plates have been spotted in Singapore's reservoirs.

Indeed, hobbyists, native to South America, are breeding in the Upper Seletar Reservoir, where they were first officially observed.

The fish, likely to have been released into the reservoir by fish hobbyists, can deliver venomous stings that can cause severe tissue damage.

But national water agency PUB, the custodian of reservoirs, has issued a warning to the public not to touch their bodies from a concrete platform instead of the water.

PUB also urged fish hobbyists not to release exotic species into the reservoirs, as well as other bodies of water.

With the hobbyists' help, PUB has been able to track down the stingrays.

Local anglers and park staff have thus far known of 10 stingray sightings in the reservoirs.

Dr Ng, a marine biologist at the National University of Singapore's School of Biological Sciences, said yesterday that the stingrays have not been identified.

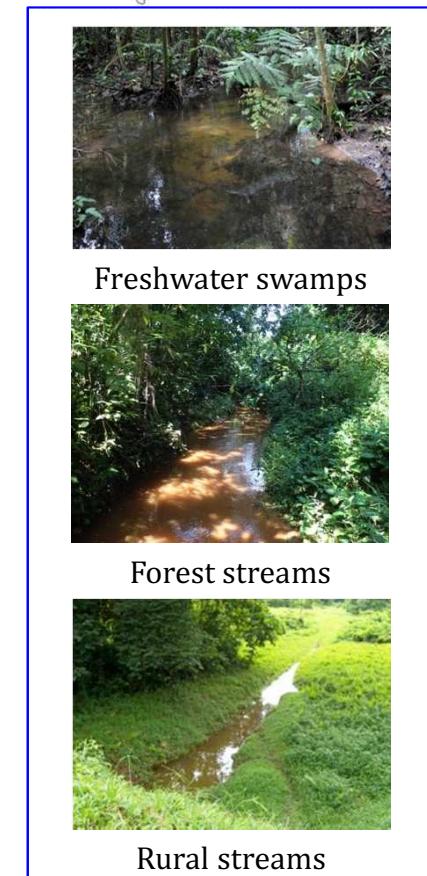

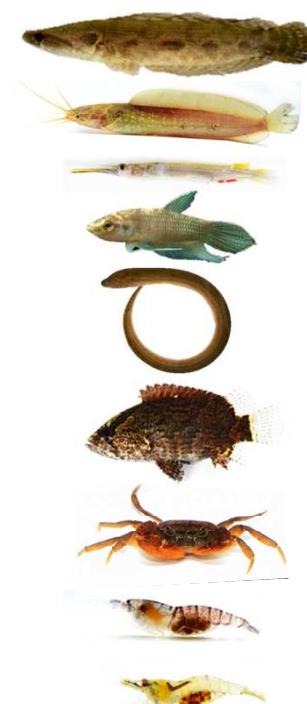

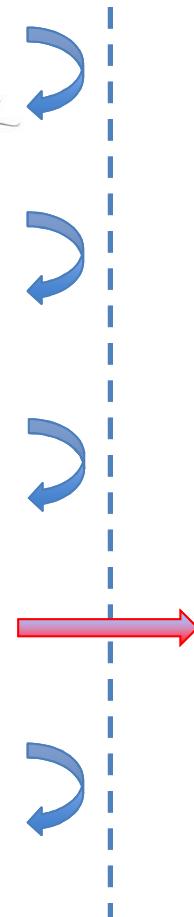

This photo by Straits Times reader shows a fisherman with a stingray in Upper Seletar Reservoir. There have been no reports so far of stingray sightings in the reservoir, says PUB.

The stingray was spotted in the Upper Seletar Reservoir, which spans about 10ha in North-eastern Singapore. It can measure nearly a metre from head to tail tip.

Work on aquatic invasives in Singapore

# **FROM PATHWAYS TO IMPACTS**

# Aquatic invasions

# Introduction pathways

→ What species are involved?

Reliable checklists:

- Surveys (field and trade); lit reviews
- DNA barcoding (COI, 16S genes)
- Risk assessment (high risk BW species)

Many species remain in the pathways,  
i.e. not released into the wild...yet

Ng TH, Tan SK, Wong WH, ..., Yeo DCJ (2016) *PLoS ONE*

Yeo DCJ, Ahyong ST, Lodge DM, ..., Lane DJW (2010) *Biofouling*  
Chong ESM, Teo SLM, Yeo DCJ (in prep)

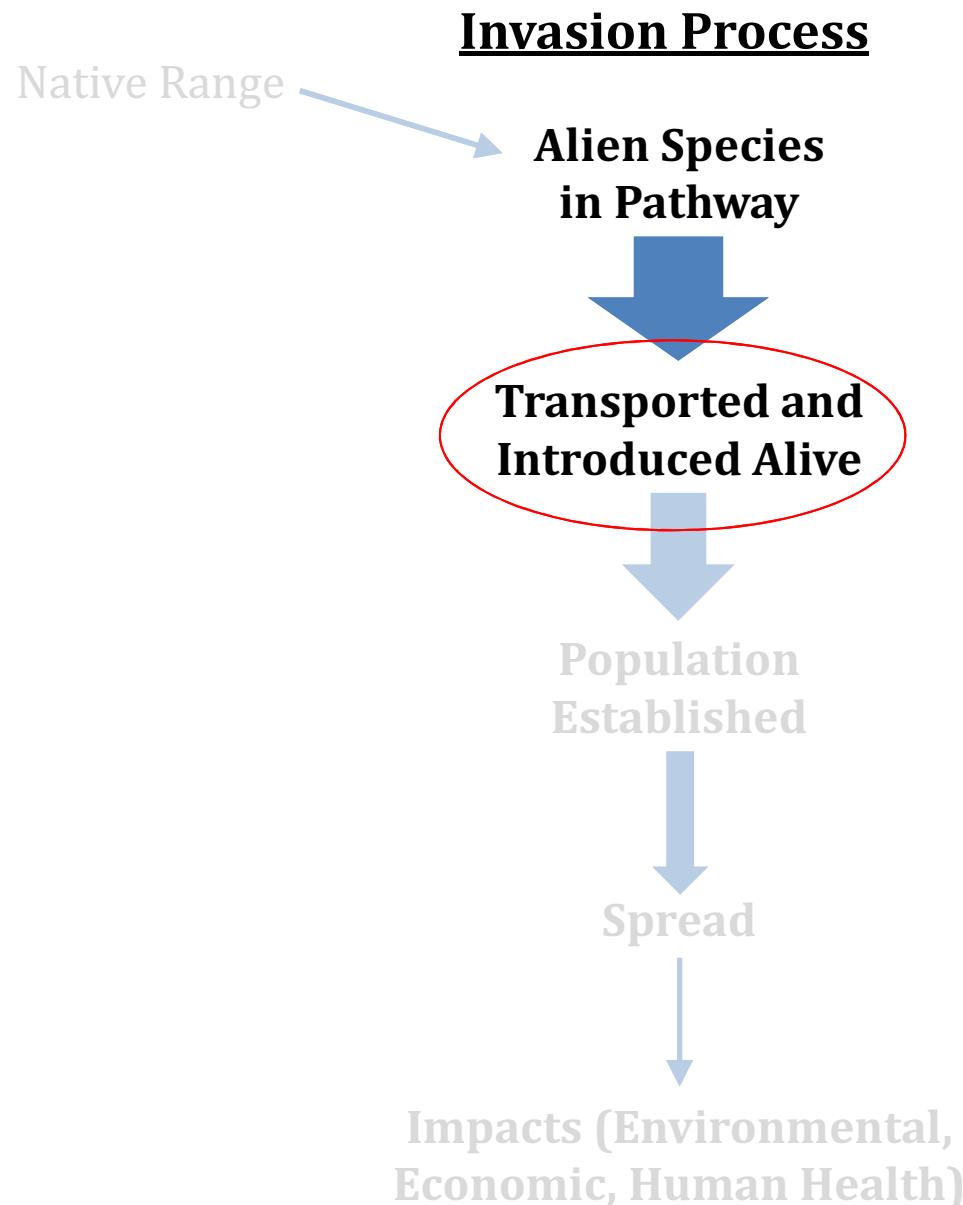

# Introduction modes/vectors

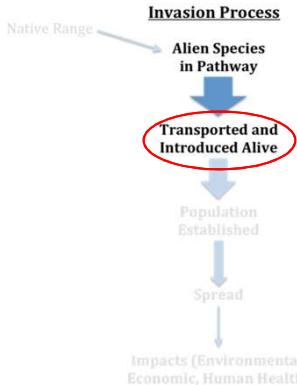

***How do alien species actually move from the pathway into the wild in Singapore?***

- Possible introduction modes
  - Unwanted/abandoned pets
  - Mercy/religious release
  - Biological control
  - Sport fishing releases
  - Bait
  - Farm escapes
  - Improper disposal of aquarium water
